

The very real and true story of

MR. CLIMATE CHANGE

Once upon a time not too long ago, in fact, even until now, humans burned lots and lots of fossil fuels to fly planes, drive cars, and keep houses bright and warm at night.

This puts greenhouse gases into the air. Those gases wrap around the planet like a blanket and make everything hotter.

A hotter planet means bigger storms. It melts towering chunks of ice as big as cities, so oceans rise and make it harder for animals to find places to live.

It's a really, really big problem, and there are a lot of smart people working hard on it, and there's also lots that you can do a small person with a big heart to help.
